CAWLEYS HAS THE ANSWER

Do you want your business to do its best in terms of recycling, but find it difficult to manage the additional work involved in pre-sorting and waste segregation? Cawleys has the answer.

Cawleys' Materials Recycling Facilities (MRF) is designed to deal with all commercial and industrial waste streams and following its recent £3 million investment in a semi-automated system aims to recover at least 60% of all the waste it collects and for some sectors like construction industry, this could be as much as 85%.

Materials recovered in the general waste load include paper, cardboard, metals and plastic.

The client's waste is tipped into a storage bay and fed onto a series of conveyor belts to begin its trip around the facility. Each area in the plant helps to separate one type of recyclable material from another. There are a number of different ways in which this happens including trommels, magnets, optical and air classification.
